

SHOPIFY STOCK FINANCIAL ANALYSIS

A Power BI Dashboard Review of Price Trends, Trading Volume & Returns

NAME	D.Monica Infanta
ROLL NO	E25DA028

Introduction

Shopify Inc. is one of the world's leading e-commerce platforms, enabling businesses of all sizes to build, manage, and grow their online stores. As a publicly traded technology company, Shopify's stock (ticker: SHOP) is closely tracked by investors and analysts as an indicator of the broader e-commerce and digital retail industry.

This report presents a financial analysis of Shopify's historical stock performance using an interactive dashboard built in Microsoft Power BI. The dashboard consolidates key market indicators such as closing price, high and low price ranges, trading volume, daily returns, and year-to-date closing values into a single, easy-to-read visual report.

The dataset spans from May 2015 to December 2025, covering a decade of Shopify's market journey - from its early growth phase, through the rapid pandemic-driven surge in 2020-2021, the sharp correction of 2022, and its subsequent recovery.

Objectives of the Analysis

- Visualize Shopify's closing price trend over the last decade.
- Compare daily high and low prices to understand price volatility.
- Track trading volume to identify periods of heightened market activity.
- Monitor daily return percentage and year-to-date (YTD) closing performance.
- Enable interactive date-range filtering and drill-through for deeper insights.

Tool Used

The dashboard was created in **Microsoft Power BI Desktop**, using a structured data model with a dedicated Date dimension table (Dim_Date) linked to the Shopify stock price fact table (SHOP_2015-05-21_2...), allowing time-intelligence calculations and hierarchy-based drill-downs by Year, Quarter, Month, and Day.

Dashboard Overview - Page 1

Figure 1: Power BI report - Page 1 (Close Price, High/Low Price, Trading Volume, Daily Return %, YTD Close)

What This Screen Shows

This is the main landing page of the Power BI report, giving a complete snapshot of Shopify's stock behaviour across the full 2015-2025 timeframe.

Close Price by Date: A line chart tracking Shopify's closing price over time. It shows a steady climb from 2015, a sharp spike around 2021, a steep decline into 2022, and a gradual recovery afterward. A tooltip highlights that on 05-07-2023 the close price was 64.44.

High Price and Low Price by Date: Two overlapping lines comparing the daily high and low prices, which helps visualize the stock's volatility - the wider the gap between the lines, the more volatile the trading day.

Trading Volume over Time: A line chart of shares traded per day, with sharp spikes indicating days of unusually high investor activity, often coinciding with earnings releases or major news events.

Daily Return % and YTD Close cards: Two KPI cards on the bottom - Daily Return % (currently 0.00% on the selected date) and YTD Close (110.65), giving a quick read of short-term and year-based performance.

Date Slicer: A slider at the top lets users filter the entire report between 21-05-2015 and 31-12-2025.

Dashboard Overview - Page 2

Figure 2: Power BI report - Page 2 (Previous Year Close KPI card)

What This Screen Shows

The second page of the report is a focused, minimal view built around a single but important metric: the **Previous Close** price, shown here as **48.46**.

This card is likely designed to work alongside the same date slicer used on Page 1, so that whichever period a user selects, this page instantly reflects the previous year's closing price for comparison against the current price shown on Page 1. This kind of year-over-year comparison is a standard technique in financial analysis, helping investors judge whether a stock has appreciated or depreciated relative to the same point a year earlier.

The visual is currently a standalone card labelled 'Previous year close', kept deliberately simple and uncluttered so the number stands out - a common design choice for executive-level dashboards where a single figure needs to be read at a glance.

Key Insights

Metric	Observation
Long-term Trend	Shopify's stock rose from single digits (2015-2016) to a peak of nearly 180 in 2021, before coming down to around 100 in 2022.
Volatility	The High/Low price chart shows widening gaps during 2020-2022, reflecting the heightened volatility in the market.
Trading Volume	Sharp volume spikes appear around 2018-2021, suggesting major news, earnings surprises, or market movements.
Recovery Phase	From 2023 onward, the price shows a renewed upward trend, indicating a gradual market recovery.
Year-over-Year	The Previous Close (48.46) versus later closing values indicates the extent of the stock's year-over-year change.

Dashboard Design Features

- Interactive date-range slicer for filtering all visuals simultaneously.
- A structured Date dimension (Dim_Date) with Year/Quarter/Month/Day hierarchy for drill-down analysis.
- Drill-through enabled with 'Keep all filters' turned on, preserving context between report pages.
- Clean KPI cards (Daily Return %, YTD Close, Previous Close) for at-a-glance performance tracking.

Conclusion

The Power BI dashboard analysed in this report offers a clear and interactive view of Shopify's stock performance from 2015 to 2025. By combining price trends, volatility indicators, trading volume, and return metrics into a single interface, it allows analysts and investors to quickly assess both the long-term trajectory and short-term fluctuations of SHOP stock.

The visuals collectively tell the story of a high-growth technology stock: rapid appreciation during its early years and the 2020-2021 e-commerce boom, followed by a significant correction in 2022, and a recovering trend into 2023-2025. Features such as the date slicer, drill-through pages, and dedicated KPI cards make the report suitable for both quick executive summaries and deeper, date-specific investigation.

Overall, this dashboard demonstrates how Power BI can transform raw historical stock data into an accessible, insight-driven financial analysis tool.
